Efficiency of 85% and better

Capacitor CT not mounted: delay of 570ms

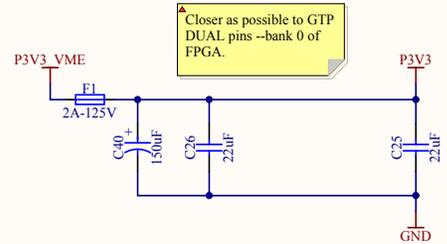

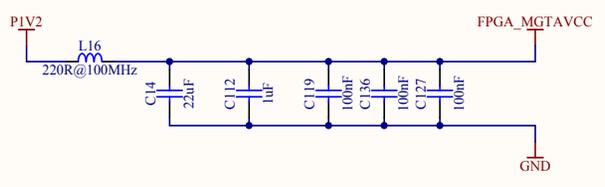

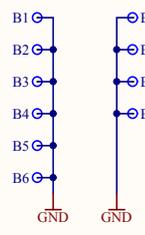

Voltages are:

*** FPGA	
VCCO_0	3V3
VCCO_1	3V3
VCCO_2	3V3
VCCO_3	3V3
VCCaux	3V3
VCCint	1V2
*** PROM	
VCCaux	3V3

Test points

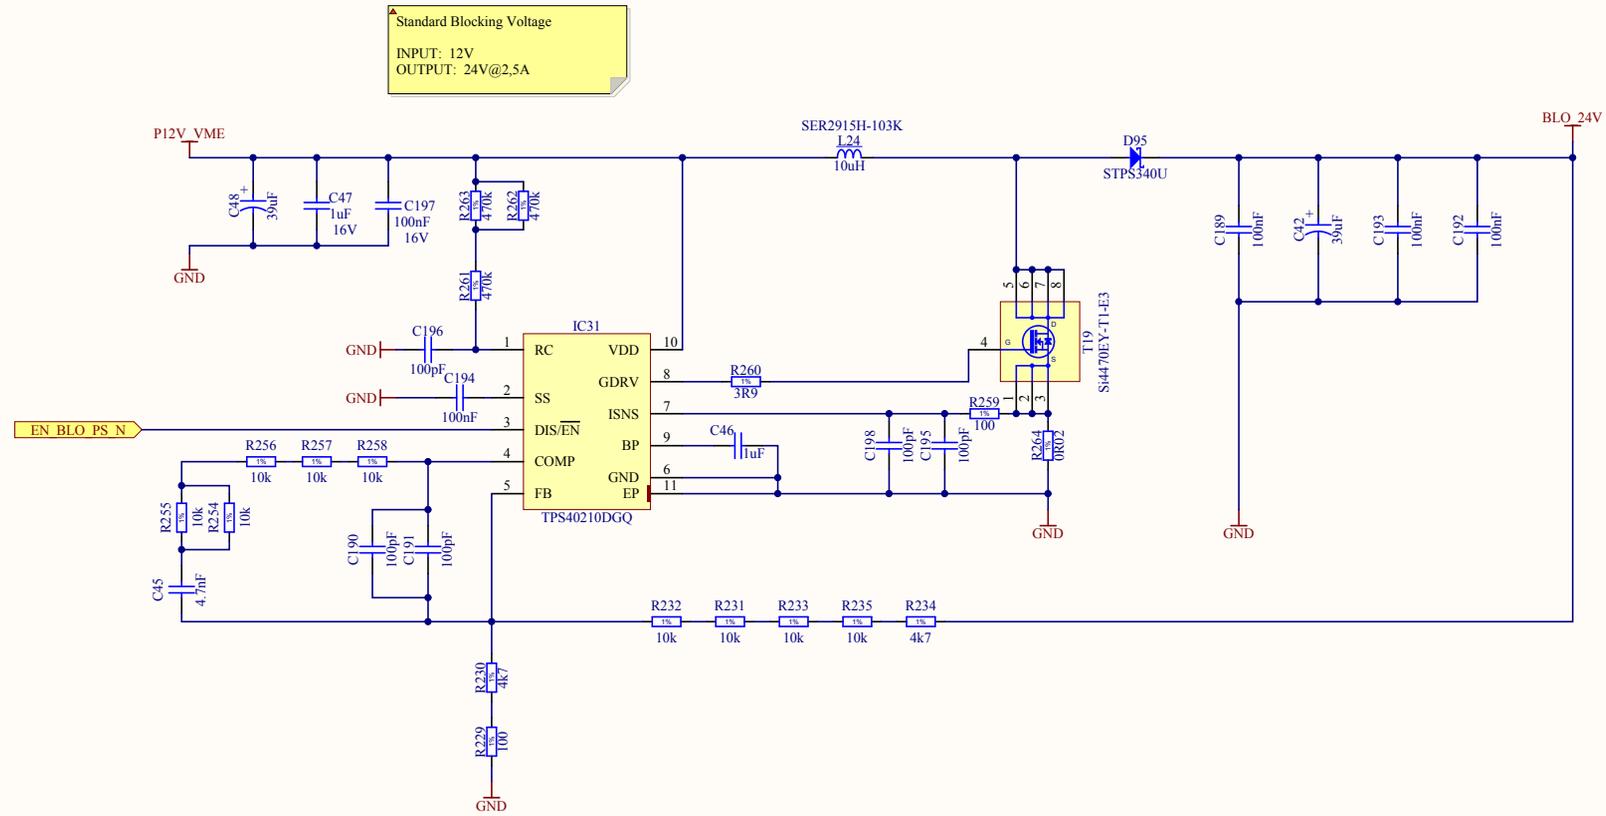

- B11 - P3V3_VME
- B12 - P1V2
- B13 - P3V3
- B14 - P1V2_VME

Closer as possible to GTP DUAL pins --bank 0 of FPGA.

Utility Bus Signal: see page 199
 ANSI/VITA 1-1994
 Output configurations in page 230
 ACFAIL_N Open collector
 SYSFAIL_N Open collector
 SYSRESET_N Open collector
 SYSCLK Totem-pole

As each block of BLO+_{X}_n, where X={L, C, R} will be triggered at the same time, cross talk should not be so critical. However, it would be better group the signals as it is shown and leave ground between sets of signals triggered by different sources.

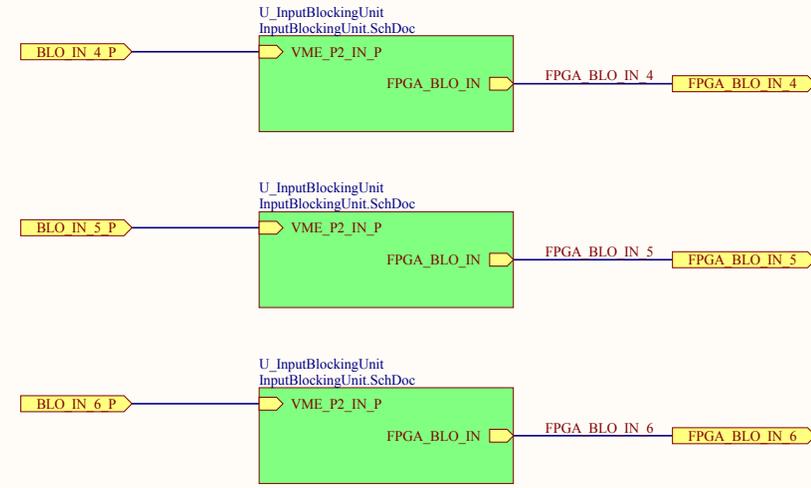

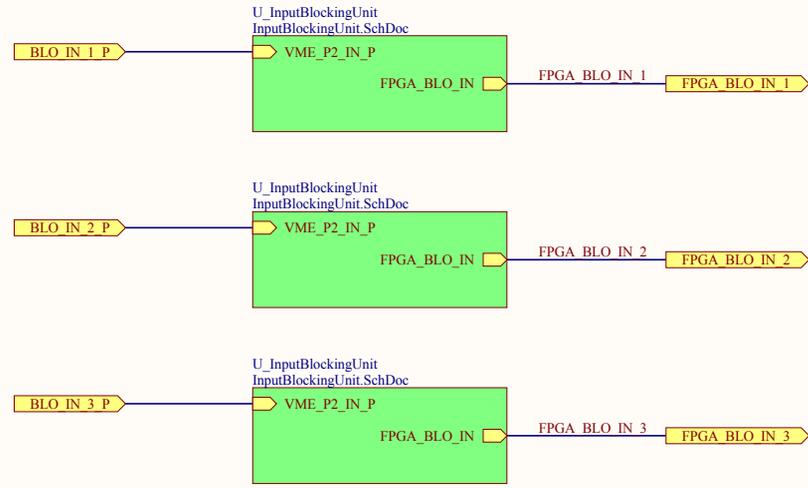

As input signals come from far away, the spectrum of this signal will have less high frequency components than the spectrum of the generated Standard Blocking in conv-ttl-blo. Signals with more spectral power in higher frequencies should be routed more carefully, so it is better to leave the easiest paths to them. In this case, outer pins should be available for output signals and inner pins to input ones.

As can be seen in ANSI/VITA 1-1994 page 247, the row b is used in VME64. Hence, none of its pins can be used. Rows z,a,c,d have available pins as documented in the VME64 and VME64x specifications.
