

- The pinout takes into account several facts:
- 1.- Return current in fast signals are more directive.
  - 2.- Blocking output is considered preferential in terms of layout.
  - 3.- Blocking input has less high spectral components than Blocking output.
  - 4.- The leds signals are faster than the rest, so are the most directives.
  - 5.- For improving coupled noise in the Blocking output, led trigger should be placed after the pulse has been already outputted.

This column is the reference for CONV-TTL-BLO modifications
