Introduction

The ATTEST™ White Rabbit Precision Time Protocol Conformance test suite consists of following test groups:

S. No.	Group	Test cases
1	Message Format Group (MFG)	6
2	WRPTP State Machine Group (WSMG)	35
3	WRPTP Configuration Group (WCG)	6
4	Inter-operability Group (IOG)	2
	Total	49

Test Plans

1. Message Format Group (MFG)

1.1. tc_conf_wrptp_mfg_001

Test Case : tc_conf_wrptp_mfg_001
Test Case Version : 1.1
Component Name : ATTEST WRPTP CONFORMANCE TEST SUITE
Module Name : Message Format Group (MFG)

Title : WRPTP Announce message - transport is over IEEE 802.3/
Ethernet

Purpose : To verify that a WRPTP enabled device sends WRPTP
Announce message in correct format when transport is
over IEEE 802.3/Ethernet.

Reference : White Rabbit Specification v2.0 July 2011, Clause 6.5.2
Pages 27 and 28

Conformance Type : MUST

Topology

Legends:

TEE : Test Execution Engine
DUT : Device Under Test
OC : Ordinary Clock
BC : Boundary Clock
T1 : Port 1 at TEE
P1 : Port 1 at DUT

Ladder Diagram :

TEE	DUT
	<Enable PTP> P1
	<Enable PTP with BC/OC clock>
	<Clock mode = One-step/Two-step>
	<Transport Protocol = IEEE 802.3/Ethernet>
	<Configure Priority1 = X, Priority2 = Y> P1
	<Enable WRPTP> P1
	<Configure wrConfig = WR_M_AND_S> P1
	<Configure default values for knownDeltaTx and P1
	knownDeltaRx>
	WRPTP ANNOUNCE [messageType = 0x0B,
	domainNumber = DN1, tlvType = 0x0003,
	wrMessageId = 0x2000]
T1	-----<<-- P1

Legends :

TEE	= Test Execution Engine
DUT	= Device Under Test
T1	= TEE's port 1
P1	= DUT's port 1
PTP	= Precision Time Protocol
WRPTP	= White Rabbit Precision Time Protocol
OC	= Ordinary Clock
BC	= Boundary Clock
DN1	= Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Verify that DUT transmits WRPTP ANNOUNCE message on port P1 with following parameters.

Ethernet Header

1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00
3) EtherType	= PTPv2 over Ethernet (0x88F7)

```

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1

P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Verify that DUT transmits WRPTP LOCK message on the port P1 with following parameters.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00

3) EtherType	= PTPv2 over Ethernet (0x88F7)
PTP Header	
4) transportSpecific	= 0 or 1, Reserved: 2-F (4 bits)
5) messageType	= 0x0C (4 bits)
6) Reserved Bits (1)	= 0 (4 bits)
7) Version	= 2 (4 bits)
8) messageLength	= 56 (2 octets)
9) domainNumber	= 0 - 255, Reserved: 128 - 255
10) Reserved Bits (2)	= 0 (8 bits)
11) flagField	= 0x0000 - 0xFFFF
12) correctionField	= 0 (8 octets)
13) Reserved Bits (3)	= 0 (32 bits)
14) sourcePortIdentity	
a) clockIdentity	= 8 octets
b) portNumber	= 2 octets
15) sequenceId	= 0 - 65535
16) controlField	= 5
17) logMessageInterval	= 127
18) targetPortIdentity	= non-zero (10 octets)
TLV Header	
19) tlvType	= 0x0003
20) lengthField	= 8 (2 octets)
21) OrganizationId	= 0x080030
22) magicNumber	= 0xDEAD
23) versionNumber	= 0x01
24) wrMessageId	= 0x1001

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1002

Step 7 : Verify that DUT transmits WRPTP CALIBRATE message on the port P1 with following parameters.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00
3) EtherType	= PTPv2 over Ethernet (0x88F7)
PTP Header	
4) transportSpecific	= 0 or 1, Reserved: 2-F (4 bits)
5) messageType	= 0x0C (4 bits)
6) Reserved Bits (1)	= 0 (4 bits)
7) Version	= 2 (4 bits)
8) messageLength	= 62 (2 octets)
9) domainNumber	= 0 - 255, Reserved: 128 - 255
10) Reserved Bits (2)	= 0 (8 bits)
11) flagField	= 0x0000 - 0xFFFF
12) correctionField	= 0 (8 octets)

13) Reserved Bits (3)	= 0 (32 bits)
14) sourcePortIdentity	
a) clockIdentity	= 8 octets
b) portNumber	= 2 octets
15) sequenceId	= 0 - 65535
16) controlField	= 5
17) logMessageInterval	= 127
18) targetPortIdentity	= non-zero (10 octets)
TLV Header	
19) tlvType	= 0x0003
20) lengthField	= 14 (2 octets)
21) OrganizationId	= 0x080030
22) magicNumber	= 0xDEAD
23) versionNumber	= 0x01
24) wrMessageId	= 0x1003
25) calSendPattern	= 0x0 (Warning, if 0x1)
26) calRetry	= 1 octet
26) calPeriod	= 4 octets

Step 8 : Verify that DUT transmits WRPTP CALIBRATED message on the port P1 with following parameters.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00
3) EtherType	= PTPv2 over Ethernet (0x88F7)
PTP Header	
4) transportSpecific	= 0 or 1, Reserved: 2-F (4 bits)
5) messageType	= 0x0C (4 bits)
6) Reserved Bits (1)	= 0 (4 bits)
7) Version	= 2 (4 bits)
8) messageLength	= 72 (2 octets)
9) domainNumber	= 0 - 255, Reserved: 128 - 255
10) Reserved Bits (2)	= 0 (8 bits)
11) flagField	= 0x0000 - 0xFFFF
12) correctionField	= 0 (8 octets)
13) Reserved Bits (3)	= 0 (32 bits)
14) sourcePortIdentity	
a) clockIdentity	= 8 octets
b) portNumber	= 2 octets
15) sequenceId	= 0 - 65535
16) controlField	= 5
17) logMessageInterval	= 127
18) targetPortIdentity	= non-zero (10 octets)
TLV Header	
19) tlvType	= 0x0003
20) lengthField	= 24 (2 octets)
21) OrganizationId	= 0x080030
22) magicNumber	= 0xDEAD
23) versionNumber	= 0x01
24) wrMessageId	= 0x1004
25) deltaTx	= 8 octets
26) deltaRx	= 8 octets

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 3000us
```

Step 10 : Send WRPTP CALIBRATED message on port T1 with following parameters

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0
  deltaRx          = 0
```

Step 11 : Verify that DUT transmits WRPTP WR_MODE_ON message on the port P1 with following parameters.

```
Ethernet Header
  1) Source MAC      = Unicast MAC
  2) Destination MAC = Unicast MAC or
                        01:1B:19:00:00:00
  3) EtherType       = PTPv2 over Ethernet (0x88F7)
PTP Header
  4) transportSpecific = 0 or 1, Reserved: 2-F
                        (4 bits)
  5) messageType      = 0x0C (4 bits)
  6) Reserved Bits (1) = 0 (4 bits)
  7) Version          = 2 (4 bits)
  8) messageLength     = 56 (2 octets)
  9) domainNumber     = 0 - 255, Reserved: 128 - 255
  10) Reserved Bits (2) = 0 (8 bits)
  11) flagField        = 0x0000 - 0xFFFF
  12) correctionField  = 0 (8 octets)
  13) Reserved Bits (3) = 0 (32 bits)
  14) sourcePortIdentity
      a) clockIdentity = 8 octets
      b) portNumber    = 2 octets
  15) sequenceId       = 0 - 65535
  16) controlField     = 5
  17) logMessageInterval = 127
  18) targetPortIdentity = non-zero (10 octets)
TLV Header
  19) tlvType          = 0x0003
  20) lengthField      = 8 (2 octets)
  21) OrganizationId   = 0x080030
  22) magicNumber      = 0xDEAD
  23) versionNumber    = 0x01
```

24) wrMessageId = 0x1005

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port P1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
grandmasterPriority1	= X - 1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 4 : Wait until completion of BMCA and verify that DUT transmits WRPTP SLAVE_PRESENT message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or

	01:1B:19:00:00:00
3) EtherType	= PTPv2 over Ethernet (0x88F7)
PTP Header	
4) transportSpecific	= 0 or 1, Reserved: 2-F (4 bits)
5) messageType	= 0x0C (4 bits)
6) Reserved Bits (1)	= 0 (4 bits)
7) Version	= 2 (4 bits)
8) messageLength	= 56 (2 octets)
9) domainNumber	= 0 - 255, Reserved: 128 - 255
10) Reserved Bits (2)	= 0 (8 bits)
11) flagField	= 0x0000 - 0xFFFF
12) correctionField	= 0 (8 octets)
13) Reserved Bits (3)	= 0 (32 bits)
14) sourcePortIdentity	
a) clockIdentity	= 8 octets
b) portNumber	= 2 octets
15) sequenceId	= 0 - 65535
16) controlField	= 5
17) logMessageInterval	= 127
18) targetPortIdentity	= non-zero (10 octets)
TLV Header	
19) tlvType	= 0x0003
20) lengthField	= 8 (2 octets)
21) OrganizationId	= 0x080030
22) magicNumber	= 0xDEAD
23) versionNumber	= 0x01
24) wrMessageId	= 0x1000

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 6 : Verify that DUT transmits WRPTP LOCKED message on the port P1 with following parameters.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00
3) EtherType	= PTPv2 over Ethernet (0x88F7)
PTP Header	
4) transportSpecific	= 0 or 1, Reserved: 2-F (4 bits)
5) messageType	= 0x0C (4 bits)
6) Reserved Bits (1)	= 0 (4 bits)
7) Version	= 2 (4 bits)
8) messageLength	= 56 (2 octets)
9) domainNumber	= 0 - 255, Reserved: 128 - 255
10) Reserved Bits (2)	= 0 (8 bits)
11) flagField	= 0x0000 - 0xFFFF

12) correctionField	= 0 (8 octets)
13) Reserved Bits (3)	= 0 (32 bits)
14) sourcePortIdentity	
a) clockIdentity	= 8 octets
b) portNumber	= 2 octets
15) sequenceId	= 0 - 65535
16) controlField	= 5
17) logMessageInterval	= 127
18) targetPortIdentity	= non-zero (10 octets)
TLV Header	
19) tlvType	= 0x0003
20) lengthField	= 8 (2 octets)
21) OrganizationId	= 0x080030
22) magicNumber	= 0xDEAD
23) versionNumber	= 0x01
24) wrMessageId	= 0x1002

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1003
calSendPattern	= FALSE
calRetry	= 0
calPeriod	= 3000us

Step 8 : Send WRPTP CALIBRATED message on port T1 with following parameters

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1004
deltaTx	= 0
deltaRx	= 0

Step 9 : Verify that DUT transmits WRPTP CALIBRATE message on the port P1 with following parameters.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00
3) EtherType	= PTPv2 over Ethernet (0x88F7)
PTP Header	
4) transportSpecific	= 0 or 1, Reserved: 2-F (4 bits)
5) messageType	= 0x0C (4 bits)
6) Reserved Bits (1)	= 0 (4 bits)
7) Version	= 2 (4 bits)
8) messageLength	= 62 (2 octets)

9) domainNumber	= 0 - 255, Reserved: 128 - 255
10) Reserved Bits (2)	= 0 (8 bits)
11) flagField	= 0x0000 - 0xFFFF
12) correctionField	= 0 (8 octets)
13) Reserved Bits (3)	= 0 (32 bits)
14) sourcePortIdentity	
a) clockIdentity	= 8 octets
b) portNumber	= 2 octets
15) sequenceId	= 0 - 65535
16) controlField	= 5
17) logMessageInterval	= 127
18) targetPortIdentity	= non-zero (10 octets)
TLV Header	
19) tlvType	= 0x0003
20) lengthField	= 14 (2 octets)
21) OrganizationId	= 0x080030
22) magicNumber	= 0xDEAD
23) versionNumber	= 0x01
24) wrMessageId	= 0x1003
25) calSendPattern	= 0x0 (Warning, if 0x1)
26) calRetry	= 1 octet
26) calPeriod	= 4 octets

Step 10 : Verify that DUT transmits WRPTP CALIBRATED message on the port P1 with following parameters.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00
3) EtherType	= PTPv2 over Ethernet (0x88F7)
PTP Header	
4) transportSpecific	= 0 or 1, Reserved: 2-F (4 bits)
5) messageType	= 0x0C (4 bits)
6) Reserved Bits (1)	= 0 (4 bits)
7) Version	= 2 (4 bits)
8) messageLength	= 72 (2 octets)
9) domainNumber	= 0 - 255, Reserved: 128 - 255
10) Reserved Bits (2)	= 0 (8 bits)
11) flagField	= 0x0000 - 0xFFFF
12) correctionField	= 0 (8 octets)
13) Reserved Bits (3)	= 0 (32 bits)
14) sourcePortIdentity	
a) clockIdentity	= 8 octets
b) portNumber	= 2 octets
15) sequenceId	= 0 - 65535
16) controlField	= 5
17) logMessageInterval	= 127
18) targetPortIdentity	= non-zero (10 octets)
TLV Header	
19) tlvType	= 0x0003
20) lengthField	= 24 (2 octets)
21) OrganizationId	= 0x080030
22) magicNumber	= 0xDEAD
23) versionNumber	= 0x01
24) wrMessageId	= 0x1004

25) deltaTx = 8 octets
 26) deltaRx = 8 octets

- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003

wrMessageID = 0x1000

Step 5 : Verify that DUT transmits WRPTP LOCK message on the port P1 with following parameters.

Ethernet Header

- 1) Source MAC = Unicast MAC
- 2) Destination MAC = Unicast MAC or 01:00:5E:00:01:81
- 3) EtherType = IPv4 (0x800)

IPv4 Fields

- 4) IP Protocol = 17 (UDP)

- 19) Reserved Bits (3) = 0 (32 bits)
- 20) sourcePortIdentity
 - a) clockIdentity = 8 octets
 - b) portNumber = 2 octets
- 21) sequenceId = 0 - 65535
- 22) controlField = 5
- 23) logMessageInterval = 127
- 24) targetPortIdentity = non-zero (10 octets)

TLV Header

- 25) tlvType = 0x0003
- 26) lengthField = 24 (2 octets)
- 27) OrganizationId = 0x080030
- 28) magicNumber = 0xDEAD
- 29) versionNumber = 0x01
- 30) wrMessageId = 0x1004
- 31) deltaTx = 8 octets
- 32) deltaRx = 8 octets

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

PTP Header

- messageType = 0x0C
- domainNumber = DN1
- targetPortIdentity = SPI1

TLV

- tlvType = 0x0003
- wrMessageId = 0x1003
- calSendPattern = FALSE
- calRetry = 0
- calPeriod = 3000us

Step 10 : Send WRPTP CALIBRATED message on port T1 with following parameters

PTP Header

```

messageType      = 0x0C
domainNumber     = DN1
targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003
  wrMessageId     = 0x1004
  deltaTx        = 0
  deltaRx        = 0

```

Step 11 : Verify that DUT transmits WRPTP WR_MODE_ON message on the port P1 with following parameters.

```

Ethernet Header
  1) Source MAC      = Unicast MAC
  2) Destination MAC = Unicast MAC or
                        01:00:5E:00:01:81
  3) EtherType       = IPv4 (0x800)

```

```

IPv4 Fields
  4) IP Protocol = 17 (UDP)

1.6. tc_conf_wrptp_mfg_006

Test Case : tc_conf_wrptp_mfg_006
Test Case Version : 1.1
Component Name : ATTEST WRPTP CONFORMANCE TEST SUITE
Module Name : Message Format Group (MFG)

Title : WRPTP Signaling message - WR Slave - transport is over IPv4/UDP.

Purpose : To verify that a WRPTP enabled device sends WRPTP Signaling messages (SLAVE_PRESENT, LOCKED, CALIBRATE and CALIBRATED) in correct format when its port is WR Slave and transport is over IPv4/UDP.

Reference : White Rabbit Specification v2.0 July 2011, Clause 6.5.3 Pages 28 and 29

Conformance Type : MUST

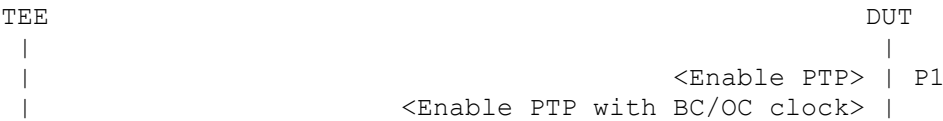

Topology

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IPv4/UDP.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port P1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
grandmasterPriority1	= X - 1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 4 : Wait until completion of BMCA and verify that DUT transmits WRPTP SLAVE_PRESENT message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

Ethernet Header	
1) Source MAC	= Unicast MAC
2) Destination MAC	= Unicast MAC or 01:1B:19:00:00:00
3) EtherType	= IPv4 (0x800)

IPv4 Fields

- 4) IP Protocol = 17 (UDP)
- 5) Destination IP = 224.0.1.129
- 6) Source IP = Unicast IP
- 7) Checksum = Valid

UDP Fields

- 8) UDP Destination Port = 320 (General Message)
- 9) Checksum = Valid

PTP Header

- 10) transportSpecific = 0 or 1, Reserved: 2-F (4 bits)
- 11) messageType = 0x0C (4 bits)
- 12) Reserved Bits (1) = 0 (4 bits)
- 13) Version = 2 (4 bits)
- 14) messageLength = 56 (2 octets)
- 15) domainNumber = 0 - 255, Reserved: 128 - 255
- 16) Reserved Bits (2) = 0 (8 bits)
- 17) flagField = 0x0000 - 0xFFFF
- 18) correctionField = 0 (8 octets)
- 19) Reserved Bits (3) = 0 (32 bits)
- 20) sourcePortIdentity
 - a) clockIdentity = 8 octets
 - b) portNumber = 2 octets
- 21) sequenceId = 0 - 65535
- 22) controlField = 5
- 23) logMessageInterval = 127
- 24) targetPortIdentity = non-zero (10 octets)

TLV Header

- 25) tlvType = 0x0003
- 26) lengthField = 8 (2 octets)
- 27) OrganizationId = 0x080030
- 28) magicNumber = 0xDEAD
- 29) versionNumber = 0x01
- 30) wrMessageId = 0x1000

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

PTP Header

- messageType = 0x0C
- domainNumber = DN1
- targetPortIdentity = SPI1

TLV

- tlvType = 0x0003
- wrMessageId = 0x1001

Step 6 : Verify that DUT transmits WRPTP LOCKED message on the port P1 with following parameters.

Ethernet Header

- 1) Source MAC = Unicast MAC
- 2) Destination MAC = Unicast MAC or 01:1B:19:00:00:00
- 3) EtherType = IPv4 (0x800)

IPv4 Fields

- 4) IP Protocol = 17 (UDP)

- 19) Reserved Bits (3) = 0 (32 bits)
- 20) sourcePortIdentity
 - a) clockIdentity = 8 octets
 - b) portNumber = 2 octets
- 21) sequenceId = 0 - 65535
- 22) controlField = 5
- 23) logMessageInterval = 127
- 24) targetPortIdentity = non-zero (10 octets)

TLV Header

- 25) tlvType = 0x0003
- 26) lengthField = 8 (2 octets)
- 27) OrganizationId = 0x080030
- 28) magicNumber = 0xDEAD
- 29) versionNumber = 0x01
- 30) wrMessageId = 0x1002

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

PTP Header

- messageType = 0x0C
- domainNumber = DN1
- targetPortIdentity = SPI1

TLV

- tlvType = 0x0003
- wrMessageId = 0x1003
- calSendPattern = FALSE
- calRetry = 0
- calPeriod = 3000us

Step 8 : Send WRPTP CALIBRATED message on port T1 with following parameters

PTP Header

- messageType = 0x0C
- domainNumber = DN1
- targetPortIdentity = SPI1

TLV

- tlvType = 0x0003
- wrMessageId = 0x1004

deltaTx = 0
deltaRx = 0

Step 9 : Verify that DUT transmits WRPTP CALIBRATE message on the port P1 with following parameters.

Ethernet Header

- 1) Source MAC = Unicast MAC
- 2) Destination MAC = Unicast MAC or 01:1B:19:00:00:00
- 3) EtherType = IPv4 (0x800)

P1	= DUT's port 1
PTP	= Precision Time Protocol
WRPTP	= White Rabbit Precision Time Protocol
OC	= Ordinary Clock
BC	= Boundary Clock
DN1	= Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters:

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Verify that WRPTP portState of port P1 is in IDLE state.

- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000

```

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters and store the received timestamp as TS1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters and store the received timestamp as TS2.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 7 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters and store the received timestamp as TS3.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 8 : Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 15000ms$ (WR_M_LOCK_TIMEOUT).

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 6 : Observe that WRPTP portState of port P1 is in M_LOCK state.

Step 7 : Wait for 15000ms to complete 1 x WR_M_LOCK_TIMEOUT.

Step 8 : Send WRPTP LOCKED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1002

```

Step 9 : Verify that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 10: Verify that WRPTP portState of port P1 is in CALIBRATION state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

  wrMessageID      = 0x1000

```

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1002

```

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 9 : Wait for 1230ms ((WR_CALIBRATED_TIMEOUT * (WR_STATE_RETRY + 1)) + (10% of WR_CALIBRATED_TIMEOUT)) for EXC_TIMEOUT_RETRY to occur.

Step 10: Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header

```

```

messageType      = 0x0C
domainNumber     = DN1
targetPortIdentity = SPI1
TLV
tlvType          = 0x0003
wrMessageId      = 0x1003

```

Step 11: Verify that WRPTP portState of port P1 is in IDLE state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

Legends

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header
 messageType = 0x0B

domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1002

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1003

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1004

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1003
  calSendPattern    = FALSE
  calRetry          = 0
  calPeriod         = 0

```

Step 10: Wait for 150ms (0.5 x WR_RESP_CALIB_REQ_TIMEOUT) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 11: Wait for 300ms to complete 1 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 12: Verify that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

```

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 0

```

Step 10: Wait for 300ms to complete 1 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 11: Send WRPTP CALIBRATED message on port T1 with following parameters

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003

```

```

wrMessageId      = 0x1004
deltaTx          = 0
deltaRx          = 0

```

Step 12: Verify that DUT transmits WRPTP WR_MODE_ON message on the port P1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1005

```

Note :

Values mentioned in above steps are examples based on default values. Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.

- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1002

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003

```

wrMessageId          = 0x1003

```

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber        = DN1
TLV
  tlvType              = 0x0003
  wrMessageId          = 0x1004

```

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber        = DN1
  targetPortIdentity  = SPI1
TLV
  tlvType              = 0x0003
  wrMessageId          = 0x1003
  calSendPattern       = FALSE
  calRetry              = 0
  calPeriod            = 0

```

Step 10: Wait for 1230ms ((WR_RESP_CALIB_REQ_TIMEOUT * (WR_STATE_RETRY + 1)) + (10% of WR_RESP_CALIB_REQ_TIMEOUT)) for EXC_TIMEOUT_RETRY to occur.

Step 11: Send WRPTP CALIBRATED message on port T1 with following parameters

```

PTP Header
  messageType        = 0x0C
  domainNumber        = DN1
  targetPortIdentity  = SPI1
TLV
  tlvType              = 0x0003
  wrMessageId          = 0x1004
  deltaTx              = 0
  deltaRx              = 0

```

Step 12 : Observe that DUT does not transmit WRPTP WR_MODE_ON message on the port P1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber        = DN1
TLV
  tlvType              = 0x0003
  wrMessageId          = 0x1005

```

Step 13: Verify that WRPTP portState of port P1 is in IDLE state.

Note :

Values mentioned in above steps are examples based on default values.
However, the test will be executed using the values given in ATTEST GUI

(Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1002
```

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
```

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
```

```
wrMessageId          = 0x1004
```

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType        = 0x0C
  domainNumber        = DN1
  targetPortIdentity  = SPI1
TLV
  tlvType             = 0x0003
  wrMessageId         = 0x1003
  calSendPattern       = FALSE
  calRetry            = 1
  calPeriod           = 50ms
```

Step 10: Wait for 150ms (0.5 x WR_RESP_CALIB_REQ_TIMEOUT) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 11: Wait for 300ms to complete 1 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 12: Send WRPTP CALIBRATED message on port T1 with following parameters

```
PTP Header
  messageType        = 0x0C
  domainNumber        = DN1
  targetPortIdentity  = SPI1
TLV
  tlvType             = 0x0003
  wrMessageId         = 0x1004
  deltaTx             = 0
  deltaRx             = 0
```

Step 13 : Verify that DUT transmits WRPTP WR_MODE_ON message on the port P1 with following parameters.

```
PTP Header
  messageType        = 0x0C
  domainNumber        = DN1
  targetPortIdentity  = SPI1
TLV
  tlvType             = 0x0003
  wrMessageId         = 0x1005
```

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

- viii. Enable WRPTP on port P1.
- ix. Configure wrConfig = WR_M_AND_S.
- x. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C

domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1002

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1003

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1004

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1003
calSendPattern	= FALSE
calRetry	= 3

calPeriod = 50ms

Step 10: Wait for 150ms ($0.5 \times \text{WR_RESP_CALIB_REQ_TIMEOUT}$) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 11: Wait for 1230ms ($(\text{WR_RESP_CALIB_REQ_TIMEOUT} \times (\text{WR_STATE_RETRY} + 1)) + (10\% \text{ of } \text{WR_RESP_CALIB_REQ_TIMEOUT})$) for EXC_TIMEOUT_RETRY to occur.

Step 12: Send WRPTP CALIBRATED message on port T1 with following parameters

PTP Header		
messageType	=	0x0C
domainNumber	=	DN1
targetPortIdentity	=	SPI1
TLV		
tlvType	=	0x0003
wrMessageId	=	0x1004
deltaTx	=	0
deltaRx	=	0

Step 13: Verify that WRPTP portState of port P1 is in IDLE state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	

```
tlvType          = 0x0003
wrMessageId      = 0x1002
```

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1003
```

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```
PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1004
```

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
  targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1003
  calSendPattern = FALSE
  calRetry       = 0
  calPeriod      = 0
```

Step 10: Send WRPTP CALIBRATED message on port T1 with following parameters

```
PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
  targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1004
  deltaTx        = 0
  deltaRx        = 0
```

Step 11 : Verify that DUT transmits WRPTP WR_MODE_ON message on the port P1 with following parameters.

```
PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
  targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003
```

wrMessageId = 0x1005

Step 12: Verify that WRPTP portState of port P1 is in IDLE state.

2.17. tc_conf_wrptp_wsmg_017

Test Case : tc_conf_wrptp_wsmg_017
 Test Case Version : 1.2
 Component Name : ATTEST WRPTP CONFORMANCE TEST SUITE
 Module Name : WRPTP State Machine Group (WSMG)

Title : Storing of otherPortDeltaTx, otherPortDeltaRx,
 otherPortCalPeriod, otherPortCalRetry and
 otherPortCalSendPattern in WR Master

Purpose : To verify that a WRPTP enabled device with it's port in
 PTP Master stores otherPortDeltaTx, otherPortDeltaRx,
 otherPortCalPeriod, otherPortCalRetry and
 otherPortCalSendPattern received in CALIBRATE message.

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV

```

```

tlvType          = 0x0003
wrMessageId      = 0x2000

```

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
  targetPortIdentity = SPI1
TLV
  tlvType         = 0x0003
  wrMessageID     = 0x1000

```

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1001

```

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
  targetPortIdentity = SPI1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1002

```

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1003

```

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1004

```

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header

```

```

        messageType      = 0x0C
        domainNumber      = DN1
        targetPortIdentity = SPI1
    TLV
        tlvType           = 0x0003
        wrMessageId        = 0x1003
        calSendPattern     = FALSE
        calRetry           = 0
        calPeriod          = 0

```

Step 10: Send WRPTP CALIBRATED message on port T1 with following parameters

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
        targetPortIdentity = SPI1
    TLV
        tlvType           = 0x0003
        wrMessageId        = 0x1004
        deltaTx            = 0
        deltaRx            = 0

```

Step 11: Verify otherPortDeltaTx = 0 on port P1.

Step 12: Verify otherPortDeltaRx = 0 on port P1.

Step 13: Verify otherPortCalSendPattern = FALSE on port P1.

Step 14: Verify otherPortCalPeriod = 0 on port P1.

Step 15: Verify otherPortCalRetry = 0 on port P1.

(Part 2)

Step 16: Disable WRPTP on port P1.

Step 17: Enable WRPTP on port P1.

Step 18: Wait for WRPTP to be enabled.

Step 19: Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```

    PTP Header
        messageType      = 0x0B
        domainNumber      = DN1
    TLV
        tlvType           = 0x0003
        wrMessageId        = 0x2000

```

Step 20: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
        targetPortIdentity = SPI1

```

```

TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 21: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 22: Send WRPTP LOCKED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1002

```

Step 23: Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 24: Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 25: Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = TRUE
  calRetry         = 3
  calPeriod        = 3000us

```

Step 26: Send WRPTP CALIBRATED message on port T1 with following parameters

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1004
  deltaTx           = 226214
  deltaRx           = 226758

```

Step 27: Verify otherPortDeltaTx = 226214 on port P1.

Step 28: Verify otherPortDeltaRx = 226758 on port P1.

Step 29: Verify otherPortCalSendPattern = TRUE on port P1.

Step 30: Verify otherPortCalPeriod = 3000us on port P1.

Step 31: Verify otherPortCalRetry = 3 on port P1.

Legends :

TEE	= Test Execution Engine
DUT	= Device Under Test
T1	= TEE's port 1
P1	= DUT's port 1
PTP	= Precision Time Protocol
WRPTP	= White Rabbit Precision Time Protocol
OC	= Ordinary Clock
BC	= Boundary Clock
DN1	= Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn        = 0

```

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Verify that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV

```

```
tlvType          = 0x0003
wrMessageID      = 0x1002
```

Step 7 : Verify that WRPTP portState of port P1 is in LOCKED state.

2.22. tc_conf_wrptp_wsmg_022

- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
grandmasterPriority1	= X - 1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters and store the received timestamp as TS1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType           = 0x0003
  wrMessageID      = 0x1002

```

Step 7 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters and store the received timestamp as TS2.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType           = 0x0003
  wrMessageID      = 0x1002

```

Step 8 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters and store the received timestamp as TS3.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType           = 0x0003
  wrMessageID      = 0x1002

```

Step 9 : Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 300ms$ (WR_LOCKED_TIMEOUT).

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
TLV
  tlvType        = 0x0003
  wrMessageID    = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
  targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1003
  calSendPattern = FALSE
  calRetry       = 0
  calPeriod      = 0

```

Step 8 : Wait for 150ms (0.5 x WR_RESP_CALIB_REQ_TIMEOUT) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 9 : Wait for 300ms to complete 1 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 10: Observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

2.26. tc_conf_wrptp_wsmg_026

Test Case : tc_conf_wrptp_wsmg_026

Test Case Version : 1.3
Component Name : ATTEST WRPTP CONFORMANCE TEST SUITE
Module Name : WRPTP State Machine Group (WSMG)

Title : WR Slave re-entering of WRPTP portState - RESP_CALIB_REQ
- on expiry of WR_RESP_CALIB_REQ_TIMEOUT -
otherPortCalPeriod and otherPortCalRetry > 0x0

Purpose : To verify that a WRPTP enabled device with it's port in
PTP Slave re-enters to it's port WR state RESP_CALIB_REQ
on expiry of WR_RESP_CALIB_REQ_TIMEOUT when
otherPortCalPeriod is greater than 0x0
(otherPortCalPeriod and otherPortCalRetry should be
ignored by DUT).

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock

BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Configure logAnnounceInterval = 4.
- viii. Enable WRPTP on port P1.
- ix. Configure wrConfig = WR_M_AND_S.
- x. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
grandmasterPriority1	= X - 1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1

```

TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 1
  calPeriod        = 50ms

```

Step 8 : Wait for 150ms (0.5 x WR_RESP_CALIB_REQ_TIMEOUT) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 9 : Wait for 300ms to complete 1 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 10: Verify that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

2.27. tc_conf_wrptp_wsmg_027

```

Test Case       : tc_conf_wrptp_wsmg_027
Test Case Version : 1.3
Component Name  : ATTEST WRPTP CONFORMANCE TEST SUITE
Module Name     : WRPTP State Machine Group (WSMG)

Title           : WR Slave transition of WRPTP portState from
                  RESP_CALIB_REQ to CALIBRATION before EXC_TIMEOUT_RETRY
                  occurs - otherPortCalPeriod and otherPortCalRetry are
                  0x0

```

Purpose : To verify that a WRPTP enabled device with it's port in PTP Slave sends CALIBRATE message and transitions it's port WR state from RESP_CALIB_REQ to CALIBRATION state on the reception of CALIBRATED message before EXC_TIMEOUT_RETRY occurs when otherPortCalPeriod and otherPortCalRetry are 0x0.

wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with

following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002
```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 0
```

Step 8 : Wait for 300ms to complete 1 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 9 : Send WRPTP CALIBRATED message on port T1 with following parameters

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0
  deltaRx          = 0
```

Step 10: Verify that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
```

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Configure logAnnounceInterval = 4.
- viii. Enable WRPTP on port P1.
- ix. Configure wrConfig = WR_M_AND_S.
- x. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0

```

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002
```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 1
  calPeriod        = 50ms
```

Step 8 : Wait for 150ms (0.5 x WR_RESP_CALIB_REQ_TIMEOUT) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 9 : Wait for 300ms to complete 1 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 10: Send WRPTP CALIBRATED message on port T1 with following parameters

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0
  deltaRx          = 0
```

Step 11: Verify that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

2.30. tc_conf_wrptp_wsmg_030

```

Test Case      : tc_conf_wrptp_wsmg_030
Test Case Version : 1.3
Component Name  : ATTEST WRPTP CONFORMANCE TEST SUITE
Module Name    : WRPTP State Machine Group (WSMG)

Title          : WR Slave transition of WRPTP portState from
                RESP_CALIB_REQ to IDLE after EXC_TIMEOUT_RETRY occurs -
                otherPortCalPeriod and otherPortCalRetry > 0x0

Purpose        : To verify that a WRPTP enabled device with it's port in
                PTP Slave transitions it's port WR state from
                RESP_CALIB_REQ to IDLE state after EXC_TIMEOUT_RETRY
                occurs when otherPortCalPeriod and otherPortCalRetry are
                greater than 0x0 (otherPortCalPeriod and
                otherPortCalRetry should be ignored by DUT).

  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 3
  calPeriod        = 1000ms

```

Step 8 : Wait for 150ms ($0.5 \times \text{WR_RESP_CALIB_REQ_TIMEOUT}$) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 9 : Wait for 1230ms ($(\text{WR_RESP_CALIB_REQ_TIMEOUT} * (\text{WR_STATE_RETRY} + 1)) + (10\% \text{ of } \text{WR_RESP_CALIB_REQ_TIMEOUT})$) for EXC_TIMEOUT_RETRY to occur.

Step 10: Send WRPTP CALIBRATED message on port T1 with following parameters

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1004
  deltaTx           = 0
  deltaRx           = 0

```

Step 11: Verify that WRPTP portState of port P1 is in IDLE state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

PTP Header
 messageType = 0x0B
 domainNumber = DN1
 grandmasterPriority1 = X - 1
 TLV
 tlvType = 0x0003
 wrMessageId = 0x2000
 wrConfig = 0x3
 calibrated = 1
 wrModeOn = 0

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

PTP Header
 messageType = 0x0C
 domainNumber = DN1
 TLV
 tlvType = 0x0003

```

wrMessageID          = 0x1000

```

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber       = DN1
  targetPortIdentity = SPI1
TLV
  tlvType             = 0x0003
  wrMessageId         = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber       = DN1
TLV
  tlvType             = 0x0003
  wrMessageID        = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber       = DN1
  targetPortIdentity = SPI1
TLV
  tlvType             = 0x0003
  wrMessageId         = 0x1003
  calSendPattern      = FALSE
  calRetry            = 0
  calPeriod           = 0

```

Step 8 : Send WRPTP CALIBRATED message on port T1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber       = DN1
  targetPortIdentity = SPI1
TLV
  tlvType             = 0x0003
  wrMessageId         = 0x1004
  deltaTx             = 0
  deltaRx             = 0

```

Step 9 : Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType        = 0x0C
  domainNumber       = DN1
TLV
  tlvType             = 0x0003
  wrMessageId         = 0x1003

```

Step 10: Observe that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 11: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS2.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 12: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS3.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 13: Verify $((TS2 - TS1) + (TS3 - TS2)) / 2 = 300ms$
(WR_CALIBRATED_TIMEOUT).

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol

OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
grandmasterPriority1	= X - 1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1

```

TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 0

```

Step 8 : Send WRPTP CALIBRATED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0
  deltaRx          = 0

```

Step 9 : Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 10: Observe that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003

```

wrMessageId = 0x1004

Step 11: Wait for 1230ms ((WR_CALIBRATED_TIMEOUT * (WR_STATE_RETRY + 1)) + (10% of WR_CALIBRATED_TIMEOUT)) for EXC_TIMEOUT_RETRY to occur.

Step 12: Send WRPTP WR_MODE_ON message on the port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1005
```

Step 13: Verify that WRPTP portState of port P1 is in IDLE state.

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0

```

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV

```

```

tlvType          = 0x0003
wrMessageID      = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
  targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1003
  calSendPattern = FALSE
  calRetry       = 0
  calPeriod      = 0

```

Step 8 : Send WRPTP CALIBRATED message on port T1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
  targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1004
  deltaTx        = 0
  deltaRx        = 0

```

Step 9 : Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1003

```

Step 10: Observe that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
TLV
  tlvType        = 0x0003
  wrMessageId    = 0x1004

```

Step 11: Send WRPTP WR_MODE_ON message on the port T1 with following parameters.

```

PTP Header
  messageType    = 0x0C
  domainNumber   = DN1
  targetPortIdentity = SPI1
TLV
  tlvType        = 0x0003

```

wrMessageId = 0x1005

Step 12: Verify otherPortDeltaTx = 0 on port P1.

Step 13: Verify otherPortDeltaRx = 0 on port P1.

Step 14: Verify otherPortCalSendPattern = FALSE on port P1.

Step 15: Verify otherPortCalPeriod = 0 on port P1.

Step 16: Verify otherPortCalRetry = 0 on port P1.

(Part 2)

Step 17: Disable WRPTP on port P1.

Step 18: Enable WRPTP on port P1.

Step 19: Wait for WRPTP to be enabled.

Step 20: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0
```

Step 21: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 22: Send WRPTP LOCK message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 23: Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002
```

Step 24: Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = TRUE
  calRetry         = 3
  calPeriod        = 3000us
```

Step 25: Send WRPTP CALIBRATED message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 226214
  deltaRx          = 226758
```

Step 26: Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
```

Step 27: Observe that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
```

Step 28: Send WRPTP WR_MODE_ON message on the port T1 with following parameters.

```
PTP Header
```

```

messageType      = 0x0C
domainNumber     = DN1
targetPortIdentity = SPI1
TLV
tlvType          = 0x0003
wrMessageId      = 0x1005

```

Step 29: Verify otherPortDeltaTx = 226214 on port P1.

Step 30: Verify otherPortDeltaRx = 226758 on port P1.

Step 31: Verify otherPortCalSendPattern = TRUE on port P1.

Step 32: Verify otherPortCalPeriod = 3000us on port P1.

Step 33: Verify otherPortCalRetry = 3 on port P1.

3. WRPTP Configuration Group (WCG)

3.1. tc_conf_wrptp_wcg_001

```

Test Case       : tc_conf_wrptp_wcg_001
Test Case Version : 1.5
Component Name   : ATTEST WRPTP CONFORMANCE TEST SUITE
Module Name      : WRPTP Configuration Group (WCG)

```

Title : Default initialization values for WRPTP attributes

Purpose : To verify that a WRPTP enabled device stores all attributes with default initialization values. Checking that the following attributes have correct default values.

- 1) defaultDS.domainNumber = 0
- 2) defaultDS.priority1 = 64
- 3) defaultDS.priority2 = 128
- 4) portDS.logSyncInterval = 0
- 5) portDS.knownDeltaTx = Default value
- 6) portDS.knownDeltaRx = Default value
- 7) portDS.wrConfig = WR_M_AND_S
- 8) portDS.calPeriod = 3000us
- 9) portDS.calRetry = 0
- 10) WR_PRESENT_TIMEOUT = 1000ms
- 11) WR_M_LOCK_TIMEOUT = 15000ms
- 12) WR_LOCKED_TIMEOUT = 300ms
- 13) WR_RESP_CALIB_REQ_TIMEOUT = 300ms
- 14) WR_CALIBRATED_TIMEOUT = 300ms
- 15) WR_STATE_RETRY = 3

Note: The default values of these attributes can be changed through ATTEST GUI (Go to Configuration Manager and select desired configuration, go to Protocol Options > WRPTP > WRPTP Attributes).

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock

BC = Boundary Clock
TS1 - TS3 = Timestamps 1 - 3

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Enable WRPTP on port P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header
messageType = 0x0B
domainNumber = 0
grandmasterPriority1 = 64
grandmasterPriority2 = 128
TLV
tlvType = 0x0003
wrMessageId = 0x2000
wrConfig = 0x3

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header
messageType = 0x0C
domainNumber = 0
targetPortIdentity = SPI1
TLV
tlvType = 0x0003
wrMessageID = 0x1000

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

PTP Header
messageType = 0x0C
domainNumber = 0
TLV
tlvType = 0x0003
wrMessageId = 0x1001

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = 0
  targetPortIdentity = SPI1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1002

```

Step 7 : Verify that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = 0
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1003
  calSendPattern    = FALSE
  calRetry          = 0
  calPeriod         = 3000us

```

Step 8 : Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = 0
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1004
  deltaTx           = Default value
  deltaRx'          = knownDeltaRx + {0 - 16000ps}

```

Step 9 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = 0
  targetPortIdentity = SPI1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1003
  calSendPattern    = FALSE
  calRetry          = 0
  calPeriod         = 3000us

```

Step 10: Send WRPTP CALIBRATED message on port T1 with following parameters

```

PTP Header
  messageType      = 0x0C
  domainNumber     = 0
  targetPortIdentity = SPI1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1004
  deltaTx           = 0

```

deltaRx = 0

Step 11 : Observe that DUT transmits WRPTP WR_MODE_ON message on the port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = 0
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1005
```

Step 12: Observe that DUT transmits SYNC message on port P1 with following parameters and store the received timestamp as TS1.

```
PTP Header
  messageType      = 0x00
  domainNumber     = 0
  logMessageInterval = 0
```

Step 13: Observe that DUT transmits SYNC message on port P1 with following parameters and store the received timestamp as TS2.

```
PTP Header
  messageType      = 0x00
  domainNumber     = 0
  logMessageInterval = 0
```

Step 14: Observe that DUT transmits SYNC message on port P1 with following parameters and store the received timestamp as TS3.

```
PTP Header
  messageType      = 0x00
  domainNumber     = 0
  logMessageInterval = 0
```

Step 15: Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 1s$.

Step 16: Disable WRPTP on port P1.

Step 17: Enable WRPTP on port P1.

Step 18: Wait for WRPTP to be enabled.

Step 19: Verify that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = 0
  grandmasterPriority1 = 64
  grandmasterPriority2 = 128
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
```

Step 20: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = 0
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 21: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters and store the received timestamp as TS1.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = 0
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 22: Verify that DUT transmits WRPTP LOCK message on port P1 with following parameters and store the received timestamp as TS2.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = 0
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 23: Verify that DUT transmits WRPTP LOCK message on port P1 with following parameters and store the received timestamp as TS3.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = 0
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 24: Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 15000\text{ms}$ (WR_M_LOCK_TIMEOUT).

Step 25: Disable WRPTP on port P1.

Step 26: Enable WRPTP on port P1.

Step 27: Wait for WRPTP to be enabled.

Step 28: Verify that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = 0
  grandmasterPriority1 = 64
```

```

        grandmasterPriority2 = 128
    TLV
        tlvType                = 0x0003
        wrMessageId            = 0x2000
        wrConfig                = 0x3

```

Step 29: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

    PTP Header
        messageType            = 0x0C
        domainNumber           = 0
        targetPortIdentity     = SPI1
    TLV
        tlvType                = 0x0003
        wrMessageID            = 0x1000

```

Step 30: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

    PTP Header
        messageType            = 0x0C
        domainNumber           = 0
    TLV
        tlvType                = 0x0003
        wrMessageId            = 0x1001

```

Step 31: Send WRPTP LOCKED message on port T1 with following parameters.

```

    PTP Header
        messageType            = 0x0C
        domainNumber           = DN1
        targetPortIdentity     = SPI1
    TLV
        tlvType                = 0x0003
        wrMessageId            = 0x1002

```

Step 32: Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

    PTP Header
        messageType            = 0x0C
        domainNumber           = DN1
    TLV
        tlvType                = 0x0003
        wrMessageId            = 0x1003

```

Step 33: Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS1.

```

    PTP Header
        messageType            = 0x0C
        domainNumber           = DN1
    TLV
        tlvType                = 0x0003
        wrMessageId            = 0x1004

```

Step 34: Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS2.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 35: Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS3.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

Step 36: Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 300ms$
(WR_CALIBRATED_TIMEOUT).

Step 37: Disable WRPTP on port P1.

Step 38: Enable WRPTP on port P1.

Step 39: Wait for WRPTP to be enabled.

Step 40: Verify that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = 0
  grandmasterPriority1 = 64
  grandmasterPriority2 = 128
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3

```

Step 41: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = 0
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 42: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

PTP Header

```

```

        messageType      = 0x0C
        domainNumber      = 0
    TLV
        tlvType            = 0x0003
        wrMessageId        = 0x1001

```

Step 43: Send WRPTP LOCKED message on port T1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
        targetPortIdentity = SPI1
    TLV
        tlvType            = 0x0003
        wrMessageId        = 0x1002

```

Step 44: Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
    TLV
        tlvType            = 0x0003
        wrMessageId        = 0x1003

```

Step 45: Observe that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
    TLV
        tlvType            = 0x0003
        wrMessageId        = 0x1004

```

Step 46: Send WRPTP CALIBRATE message on port T1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
        targetPortIdentity = SPI1
    TLV
        tlvType            = 0x0003
        wrMessageId        = 0x1003
        calSendPattern      = FALSE
        calRetry            = 0
        calPeriod           = 3000us

```

Step 47: Wait for 150ms (0.5 x WR_RESP_CALIB_REQ_TIMEOUT) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 48: Wait for 600ms to complete 2 x WR_RESP_CALIB_REQ_TIMEOUT.

Step 49: Verify that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 50: Wait for 630ms to complete 2 x WR_RESP_CALIB_REQ_TIMEOUT + 10% of

WR_RESP_CALIB_REQ_TIMEOUT.

Step 51: Verify that WRPTP portState of port P1 is in IDLE state.

Step 52: Disable WRPTP on port P1.

Step 53: Enable WRPTP on port P1.

Step 54: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
grandmasterPriority1	= X - 1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 55: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store the received timestamp as TS1.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 56: Verify that the DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters and store the received timestamp as TS2.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 57: Verify that the DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters and store the received timestamp as TS3.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 58: Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 1000ms$ (WR_PRESENT_TIMEOUT).

Step 59: Disable WRPTP on port P1.

Step 60: Enable WRPTP on port P1.

Step 61: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0

```

Step 62: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 63: Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 64: Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters and store the received timestamp as TS1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 65: Verify that the DUT transmits WRPTP LOCKED message on port P1 with following parameters and store the received timestamp as TS2.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 66: Verify that the DUT transmits WRPTP LOCKED message on port P1 with following parameters and store the received timestamp as TS3.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002
```

Step 67: Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 300ms$ (WR_LOCKED_TIMEOUT).

Step 68: Disable WRPTP on port P1.

Step 69: Enable WRPTP on port P1.

Step 70: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0
```

Step 71: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 72: Send WRPTP LOCK message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 73: Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
```

```

TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 74: Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 3000us

```

Step 75: Wait for 150ms ($0.5 \times \text{WR_RESP_CALIB_REQ_TIMEOUT}$) and observe that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 76: Wait for 600ms to complete $2 \times \text{WR_RESP_CALIB_REQ_TIMEOUT}$.

Step 77: Verify that WRPTP portState of port P1 is in RESP_CALIB_REQ state.

Step 78: Wait for 630ms to complete $2 \times \text{WR_RESP_CALIB_REQ_TIMEOUT} + 10\%$ of WR_RESP_CALIB_REQ_TIMEOUT.

Step 79: Verify that WRPTP portState of port P1 is in IDLE state.

Step 80: Disable WRPTP on port P1.

Step 81: Enable WRPTP on port P1.

Step 82: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0

```

Step 83: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 84: Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 85: Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 86: Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern    = FALSE
  calRetry          = 0
  calPeriod         = 3000us

```

Step 87: Send WRPTP CALIBRATED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0
  deltaRx          = 0

```

Step 88: Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 89: Observe that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1004

```

Step 90: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS2.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1004

```

Step 91: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters and store the received timestamp as TS3.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType           = 0x0003
  wrMessageId       = 0x1004

```

Step 92: Verify $((TS2 - TS1) + (TS3 - TS2))/2 = 300ms$
(WR_CALIBRATED_TIMEOUT).

Note :

Values mentioned in above steps are examples based on default values. However, the test will be executed using the values given in ATTEST GUI (Selected configuration in ATTEST Configuration Manager > Protocol Options > WRPTP > WRPTP Attributes). Hence, the values displayed in test logs may differ from those mentioned in the steps.

3.2. tc_conf_wrptp_wcg_002

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store grandmasterPriority1 as X.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
```

Step 4 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0
```

Step 5 : Wait until completion of BMCA and verify that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

(Part 2)

Step 6 : Configure wrConfig = WR_M_ONLY.

Step 7 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store grandmasterPriority1 as X.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x2
```

Step 8 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```
PTP Header
```

```

        messageType      = 0x0B
        domainNumber      = DN1
        grandmasterPriority1 = X - 1
    TLV
        tlvType           = 0x0003
        wrMessageId        = 0x2000
        wrConfig           = 0x3
        calibrated         = 1
        wrModeOn           = 0

```

Step 9 : Wait until completion of BMCA and verify that DUT does not transmit WRPTP SLAVE_PRESENT message on port P1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
    TLV
        tlvType           = 0x0003
        wrMessageID       = 0x1000

```

Step 10: Verify that PTP portState of port P1 is MASTER.

(Part 3)

Step 11: Configure wrConfig = WR_S_ONLY.

Step 12: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

    PTP Header
        messageType      = 0x0B
        domainNumber      = DN1
        grandmasterPriority1 = X + 1
    TLV
        tlvType           = 0x0003
        wrMessageId        = 0x2000
        wrConfig           = 0x3
        calibrated         = 1
        wrModeOn           = 0

```

Step 13: Wait for 6s to complete BMCA.

Step 14: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber      = DN1
        targetPortIdentity = SPI1
    TLV
        tlvType           = 0x0003
        wrMessageID       = 0x1000

```

Step 15: Verify that DUT does not transmit WRPTP LOCK message on port P1 with following parameters.

```

    PTP Header

```

messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 16: Verify that PTP portState of port P1 is SLAVE.

(Part 4)

Step 17: Configure wrConfig = WR_M_AND_S.

Step 18: Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store grandmasterPriority1 as X.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3

Step 19: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
grandmasterPriority1	= X + 1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000
wrConfig	= 0x3
calibrated	= 1
wrModeOn	= 0

Step 20: Wait for 6s to complete BMCA.

Step 21: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 22: Verify that DUT transmits WRPTP LOCK message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	

tlvType = 0x0003
wrMessageId = 0x1001

Step 23: Verify that PTP portState of port P1 is M_LOCK.

3.3. tc_conf_wrptp_wcg_003

Test Case : tc_conf_wrptp_wcg_003
Test Case Version : 1.2
Component Name : ATTEST WRPTP CONFORMANCE TEST SUITE
Module Name : WRPTP Configuration Group (WCG)

Title : knownDeltaTx in WR Master

Purpose : To verify that a WRPTP enabled device with it's port in PTP Master sends CALIBRATED message with configured knownDeltaTx (allowed range: UInteger64).

Reference : White Rabbit Specification v2.0 July 2011, Clause 6.3
Page 16

- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header

```

        messageType      = 0x0C
        domainNumber     = DN1
        targetPortIdentity = SPI1
    TLV
        tlvType           = 0x0003
        wrMessageID       = 0x1000

```

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber     = DN1
    TLV
        tlvType           = 0x0003
        wrMessageId      = 0x1001

```

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber     = DN1
        targetPortIdentity = SPI1
    TLV
        tlvType           = 0x0003
        wrMessageId      = 0x1002

```

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber     = DN1
    TLV
        tlvType           = 0x0003
        wrMessageId      = 0x1003

```

Step 8 : Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

    PTP Header
        messageType      = 0x0C
        domainNumber     = DN1
    TLV
        tlvType           = 0x0003
        wrMessageId      = 0x1004
        deltaTx           = Default value

```

(Part 2)

Step 9 : Disable WRPTP on port P1.

Step 10: Configure knownDeltaTx = 0 on port P1.

Step 11: Enable WRPTP on port P1.

Step 12: Wait for WRPTP to be enabled.

Step 13: Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
```

Step 14: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 15: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 16: Send WRPTP LOCKED message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1002
```

Step 17: Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
```

Step 18: Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
```

domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1004
deltaTx	= 0

(Part 3)

Step 19: Disable WRPTP on port P1.

Step 20: Configure knownDeltaTx = Default value on port P1.

Step 21: Enable WRPTP on port P1.

Step 22: Wait for WRPTP to be enabled.

Step 23: Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 24: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageID	= 0x1000

Step 25: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1001

Step 26: Send WRPTP LOCKED message on port T1 with following parameters.

PTP Header	
messageType	= 0x0C
domainNumber	= DN1
targetPortIdentity	= SPI1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x1002

Step 27: Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 28: Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000

```

```

wrConfig          = 0x3
calibrated        = 1
wrModeOn          = 0

```

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 0

```

Step 8 : Send WRPTP CALIBRATED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

```

deltaTx          = 0
deltaRx          = 0

```

Step 9 : Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1003

```

Step 10: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1004
  deltaTx         = Default value

```

(Part 2)

Step 11: Disable WRPTP on port P1.

Step 12: Configure knownDeltaTx = 0 on port P1.

Step 13: Enable WRPTP on port P1.

Step 14: Wait for WRPTP to be enabled.

Step 15: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType     = 0x0B
  domainNumber    = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x2000
  wrConfig        = 0x3
  calibrated      = 1
  wrModeOn        = 0

```

Step 16: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003

```

wrMessageID = 0x1000

Step 17: Send WRPTP LOCK message on port T1 with following parameters.

PTP Header
messageType = 0x0C
domainNumber = DN1
targetPortIdentity = SPI1
TLV
tlvType = 0x0003
wrMessageId = 0x1001

Step 18: Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

PTP Header
messageType = 0x0C
domainNumber = DN1
TLV
tlvType = 0x0003
wrMessageID = 0x1002

Step 19: Send WRPTP CALIBRATE message on port T1 with following parameters.

PTP Header
messageType = 0x0C
domainNumber = DN1
targetPortIdentity = SPI1
TLV
tlvType = 0x0003
wrMessageId = 0x1003
calSendPattern = FALSE
calRetry = 0
calPeriod = 0

Step 20: Send WRPTP CALIBRATED message on port T1 with following parameters.

PTP Header
messageType = 0x0C
domainNumber = DN1
targetPortIdentity = SPI1
TLV
tlvType = 0x0003
wrMessageId = 0x1004
deltaTx = 0
deltaRx = 0

Step 21: Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

PTP Header
messageType = 0x0C
domainNumber = DN1
TLV
tlvType = 0x0003
wrMessageId = 0x1003

Step 22: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0

```

(Part 3)

Step 23: Disable WRPTP on port P1.

Step 24: Configure knownDeltaTx = Default value on port P1.

Step 25: Enable WRPTP on port P1.

Step 26: Wait for WRPTP to be enabled.

Step 27: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0

```

Step 28: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 29: Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 30: Observe that the DUT transmits WRPTP LOCKED message on port P1 with

following parameters.

PTP Header		
messageType	=	0x0C
domainNumber	=	DN1
TLV		
tlvType	=	0x0003
wrMessageID	=	0x1002

Step 31: Send WRPTP CALIBRATE message on port T1 with following parameters.

PTP Header		
messageType	=	0x0C
domainNumber	=	DN1
targetPortIdentity	=	SPI1
TLV		
tlvType	=	0x0003
wrMessageId	=	0x1003
calSendPattern	=	FALSE
calRetry	=	0
calPeriod	=	0

Step 32: Send WRPTP CALIBRATED message on port T1 with following parameters.

PTP Header		
messageType	=	0x0C
domainNumber	=	DN1
targetPortIdentity	=	SPI1
TLV		
tlvType	=	0x0003
wrMessageId	=	0x1004
deltaTx	=	0
deltaRx	=	0

Step 33: Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

PTP Header		
messageType	=	0x0C
domainNumber	=	DN1
TLV		
tlvType	=	0x0003
wrMessageId	=	0x1003

Step 34: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

PTP Header		
messageType	=	0x0C
domainNumber	=	DN1
TLV		
tlvType	=	0x0003
wrMessageId	=	0x1004
deltaTx	=	Default value

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000

```

Step 4 : Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV

```

```

tlvType          = 0x0003
wrMessageID      = 0x1000

```

Step 5 : Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1001

```

Step 6 : Send WRPTP LOCKED message on port T1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
  targetPortIdentity = SPI1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1002

```

Step 7 : Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1003

```

Step 8 : Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType     = 0x0C
  domainNumber    = DN1
TLV
  tlvType         = 0x0003
  wrMessageId     = 0x1004
  deltaRx'        = knownDeltaRx + {0 - 16000ps}

```

(Part 2)

Step 9 : Disable WRPTP on port P1.

Step 10: Configure knownDeltaRx = 0 on port P1.

Step 11: Enable WRPTP on port P1.

Step 12: Wait for WRPTP to be enabled.

Step 13: Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000

```

Step 14: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 15: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 16: Send WRPTP LOCKED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1002

```

Step 17: Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003

```

Step 18: Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004

```

`deltaRx'` = `knownDeltaRx + {0 - 16000ps}`

(Part 3)

Step 19: Disable WRPTP on port P1.

Step 20: Configure `knownDeltaRx` = Default value on port P1.

Step 21: Enable WRPTP on port P1.

Step 22: Wait for WRPTP to be enabled.

Step 23: Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store `sourcePortIdentity` as SPI1.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
```

Step 24: Send WRPTP SLAVE_PRESENT message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 25: Observe that DUT transmits WRPTP LOCK message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 26: Send WRPTP LOCKED message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1002
```

Step 27: Observe that DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
```

```

messageType      = 0x0C
domainNumber     = DN1
TLV
tlvType          = 0x0003
wrMessageId      = 0x1003

```

Step 28: Verify that DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```

PTP Header
messageType      = 0x0C
domainNumber     = DN1
TLV
tlvType          = 0x0003
wrMessageId      = 0x1004
deltaRx'         = knownDeltaRx + {0 - 16000ps}

```

3.6. tc_conf_wrptp_wcg_006

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```

PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3

```

```

        calibrated          = 1
        wrModeOn            = 0

```

Step 4 : Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000

```

Step 5 : Send WRPTP LOCK message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001

```

Step 6 : Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002

```

Step 7 : Send WRPTP CALIBRATE message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 0

```

Step 8 : Send WRPTP CALIBRATED message on port T1 with following parameters.

```

PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0

```

deltaRx = 0

Step 9 : Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
```

Step 10: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaRx'         = knownDeltaRx + {0 - 16000ps}
```

(Part 2)

Step 11: Disable WRPTP on port P1.

Step 12: Configure knownDeltaRx = 0 on port P1.

Step 13: Enable WRPTP on port P1.

Step 14: Wait for WRPTP to be enabled.

Step 15: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0
```

Step 16: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 17: Send WRPTP LOCK message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 18: Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002
```

Step 19: Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern    = FALSE
  calRetry          = 0
  calPeriod         = 0
```

Step 20: Send WRPTP CALIBRATED message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0
  deltaRx          = 0
```

Step 21: Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
```

Step 22: Verify that the DUT transmits WRPTP CALIBRATED message on port P1

with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaRx'         = knownDeltaRx + {0 - 16000ps}
```

(Part 3)

Step 23: Disable WRPTP on port P1.

Step 24: Configure knownDeltaRx = Default value on port P1.

Step 25: Enable WRPTP on port P1.

Step 26: Wait for WRPTP to be enabled.

Step 27: Send periodic WRPTP ANNOUNCE messages on the port T1 with following parameters.

```
PTP Header
  messageType      = 0x0B
  domainNumber     = DN1
  grandmasterPriority1 = X - 1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x2000
  wrConfig         = 0x3
  calibrated       = 1
  wrModeOn         = 0
```

Step 28: Wait until completion of BMCA and observe that DUT transmits WRPTP SLAVE_PRESENT message on port P1 with following parameters. Store sourcePortIdentity as SPI1.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1000
```

Step 29: Send WRPTP LOCK message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1001
```

Step 30: Observe that the DUT transmits WRPTP LOCKED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageID      = 0x1002
```

Step 31: Send WRPTP CALIBRATE message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
  calSendPattern   = FALSE
  calRetry         = 0
  calPeriod        = 0
```

Step 32: Send WRPTP CALIBRATED message on port T1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
  targetPortIdentity = SPI1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaTx          = 0
  deltaRx          = 0
```

Step 33: Observe that the DUT transmits WRPTP CALIBRATE message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1003
```

Step 34: Verify that the DUT transmits WRPTP CALIBRATED message on port P1 with following parameters.

```
PTP Header
  messageType      = 0x0C
  domainNumber     = DN1
TLV
  tlvType          = 0x0003
  wrMessageId      = 0x1004
  deltaRx'         = knownDeltaRx + {0 - 16000ps}
```

```

Legends :

TEE = Test Execution Engine
 DUT = Device Under Test
 T1 = TEE's port 1
 P1 = DUT's port 1
 PTP = Precision Time Protocol
 WRPTP = White Rabbit Precision Time Protocol
 OC = Ordinary Clock
 BC = Boundary Clock
 DN1 = Domain Number 1

Procedure :

(Initial Part)

Step 1 : Initialization of DUT

- i. Enable DUT's port P1.
- ii. Enable PTP on port P1.
- iii. Enable PTP globally with device type as Boundary/Ordinary clock.
- iv. Configure clock mode as One-step/Two-step.
- v. Configure Network Transport Protocol as IEEE 802.3/Ethernet.
- vi. Configure default values for Priority1 = X and Priority2 = Y.
- vii. Enable WRPTP on port P1.
- viii. Configure wrConfig = WR_M_AND_S.
- ix. Configure default values for knownDeltaTx and knownDeltaRx on P1.

Step 2 : Initialization of TEE

- i. Add port T1 at TEE.

(Part 1)

Step 3 : Observe that DUT transmits WRPTP ANNOUNCE message on the port P1 with following parameters and store grandmasterPriority1 as X.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
TLV	
tlvType	= 0x0003
wrMessageId	= 0x2000

Step 4 : Send periodic ANNOUNCE messages on the port T1 with following parameters.

PTP Header	
messageType	= 0x0B
domainNumber	= DN1
correctionField	= 0
controlField	= 0x05
logMessageInterval	= 1
grandmasterPriority1	= X - 1

Step 5 : Send periodic SYNC messages on the port T1 with following parameters.

PTP Header	
messageType	= 0x00
domainNumber	= DN1
correctionField	= 0
controlField	= 0x00
logMessageInterval	= 0

Step 5a: If Two-step clock, send periodic FOLLOW_UP messages on port T1 with following parameters.

PTP Header	
messageType	= 0x08
domainNumber	= DN1
correctionField	= 0
controlField	= 0x02
logMessageInterval	= 0

Step 6 : Wait for 6s to complete BMCA.

Step 7 : Verify that DUT transmits DELAY_REQ message on port P1 with following parameters.

PTP Header	
messageType	= 0x01
domainNumber	= DN1
